

A FULL ENGINE-RACK FLEET — WEEKS AHEAD OF THE LINE.

When a Tier-1 supplier needed returnable engine racks faster than their usual source could deliver, SPF designed, welded, and finished the fleet **under one roof** — and hit the launch.

WEEKS TO DELIVER
(~HALF THE QUOTED TIME)

300+

RETURNABLE ENGINE
RACKS DELIVERED

ON-TIME

TO THE PROGRAM
RAMP / LAUNCH

THE CHALLENGE

A Tier-1 automotive supplier needed returnable steel racks to move finished engines between its machining and assembly operations — and needed them **fast**, ahead of a program ramp. Their existing rack source quoted roughly twice that — around **[12–16 weeks]** — a lead time that wouldn't make the launch date and put the line start at risk.

WHAT SPF DID

SPF engineered the engine rack in-house with SolidWorks, then cut, robotic-welded, and powder-coated the full fleet in one Byron facility — no brokered steel and no outside coater's queue to wait in. One purchase order, one accountable team, and short Southeast freight kept the whole job moving on a single clock.

THE RESULT

The full 300+-rack fleet was delivered in about **6–8 weeks** — roughly half the lead time quoted elsewhere — in time for the program ramp. The returnable racks are built to run **[N]** trips, protecting finished engines in transit and replacing **[expendable packaging]** trip after trip.

RETURNABLE STEEL RACKS · POWDER-COATED

“[SPF turned our engine racks around in about half the time we expected — and they hit our launch.]”
